# Swift Pro Potocol

## 1)Introduction

- uArm Gcode is an important part of the uArm software.
- Based on the standard gCode protocol, we add a new protocol head in front of the Gcode so that it can be more easily to use and debug.
- What's more, it is designed to be compatible with the standard Gcode. (We offer the code of decode the

standard Gcode)

## 2)Example

Sending command from PC "#25 G0 X180 Y0 Z150 F200"
//move to [180,0,150] with the speed 200mm/min

Reply from uArm "\$25 ok"

## 3)Commands(TBD)-

Command can be divided into two parts:

**Command with underline**: it's the new added protocol head.

- The command from PC starts with '#', while the command from uArm starts with'\$'.
- And the data following the symbol decided by the PC, and the reply from the uArm should have the same

data which indicates it finish the command. (In the example above, PC sends the command with '#25' and

uArm replies the command with'\$25')

Command without the underline: it's the standard Gcode.

#### Caution:

- 1. There should be blank space between each parameter;
- 2. The letters in the command should be capitalized;

#### Different modes for uArm Swift Pro

Since different types of the end-effectors have different length and height, so we designed the command M2400,

which could help us to fit the uArm into different situations easily. With this command, there is no need to concern

about how to adjust the parameters for different situations.

Currently we offer 4 kinds of mode:

M2400 S0: Normal mode (end-effector tools: suction)

M2400 S1: Laser mode (end-effector tools: laser)

M2400 S2: 3D printing mode (end-effector tools: hot end)

M2400 S3: Universal holder mode (end-effector tools: universal holder)
